

Magnetic Drum Lid Holder

The picture to the right, shows all the individual components, which make up your Magnetic Drum Lid Holder.

When you receive your unit you will find: two “S” hooks, one steel cable with two looped ends, and one magnetic assembly.

This unit, was designed to be used with Wizard Industrial Drum De-headers, in conjunction with the Wizard Drum Tower.

The unit is designed to prevent the drum lid from falling into the drum after the lid has been cut, following the use of an inside chime cutting drum opener.

INSTALLATION AND USE

1

Attach the “S” hook, furthest from the magnet assembly, to the safety chain connected to the drum de-header. The hook should be connected approx. twelve links from the top of the chain.

2

Be sure to place the magnet assembly at the center of the steel lid to be removed. The steel cable should follow the unit around the drum to prevent tangling.
